

Introduction to Artificial Intelligence for Beginners

Module 1: Introduction to AI and its Applications

- What is Artificial Intelligence?
- History and evolution of AI
- Real-world applications (healthcare, finance, entertainment, etc.)
- Categories of AI: ANI, AGI, ASI
- No-code activity: Explore AI demos using tools like Teachable Machine, Pictory, or ChatGPT

Module 2: Getting Started with No-Code AI

- Introduction to machine learning concepts (classification, regression, clustering)
- Datasets, features, and labels
- Tool: Google Teachable Machine
 - Image, Sound, Pose classification
 - Hands-on: Build and test your own image classifier
- Tool: Lobe.ai
 - Walkthrough and use case for emotion or object detection

Module 3: Data Fundamentals for AI

- Types of data (structured, unstructured, semi-structured)
- Data cleaning basics
- Intro to spreadsheets for data handling
- Tool: Microsoft Excel / Google Sheets
- Hands-on: Explore a sample dataset, clean it, visualize simple trends

Module 4: Visual AI and Computer Vision (No-code)

- Basics of computer vision
- How machines "see" (pixels, color channels)

Introduction to Artificial Intelligence for Beginners

- Tool: Microsoft Azure Custom Vision / Lobe.ai
- Project: Build a custom object detection model

Module 5: Natural Language Processing (NLP)

- Basics of how machines understand text
- Sentiment analysis, chatbots, translation
- Tool: Hugging Face Spaces / ChatGPT / Dialogflow (basic setup)
- Project: Build a no-code sentiment analyzer or basic chatbot

Module 6: Fundamentals of Machine Learning (Conceptual)

- Types of ML: Supervised, Unsupervised, Reinforcement
- Understanding accuracy, precision, recall
- Concept of training, testing, and model evaluation
- Case studies: Spam filter, movie recommendation
- Hands-on: Simulations via Google AI Experiments or Tinker With AI tools

Module 7: Transition to Low-Code ML

- Introduction to tools like Google Colab or Jupyter Notebooks
- Using prebuilt models with few lines of code (Python)
- Tool: Scikit-learn + sample datasets
- Activity: Load a dataset and run a classification model (e.g., iris dataset)

Module 8: AI Ethics and Responsible AI

- Bias in AI
- Privacy and data misuse
- Ethics of facial recognition, surveillance, and automation

Introduction to Artificial Intelligence for Beginners

- Activity: Discussion or short reflection on a current event in AI ethics

Module 9: Capstone Project

- Choose one domain: Computer Vision, NLP, or ML
- Use a no-code or low-code tool to build a complete small AI app
- Present your project

Module 10: What's Next?

- Overview of AI careers and learning paths
- Introduction to Python and ML libraries (if learners want to dive deeper)
- Resources and platforms for continued learning
